

A calm, product-led system for paid social

File-level suitability still comes from the asset register and campaign operations workbook.

Ink deep

Cream canvas

Amber focus

Sage support

Version 2026.3 · Effective 1 June 2026

Quiet confidence, visible product

One message: the campaign should be understood in a quick feed scan.

- Product proof: use a real planning interface rather than abstract automation imagery.
- Measured emphasis: amber indicates focus or action; it should not dominate the canvas.
- Human language: avoid urgency, guarantees, inflated speed claims, or AI-replacement promises.
- Current assets only: visual compatibility does not replace campaign, date, market, placement, rights, and release checks.

Use a separate light-layout wordmark

- The campaign signature is independent from the product screenshot. Branding inside the interface does not satisfy the logo placement.
- Minimum visible width at 1200 × 627: 150 px. Keep at least 24 px clear space around the signature.
- Use the top-right logo zone and keep the mark fully inside the platform safe area.
- Do not use a compact monogram, vertical lockup, dark-panel wordmark,
- swapped-color symbol, typo wordmark, or future wave identity.

The weekly board must remain identifiable

- All five weekday labels MON through FRI must remain visible after cropping.
- Retain the amber THIS WEEK cue, the highlighted WED lane, and the selected Launch checklist card.
- The interface should occupy 46-54% of the final canvas width and remain readable at feed size.
- Do not show clipped navigation fragments, partial labels, browser chrome remnants, distorted cards, or a crop that begins at WED.

Structure without visual noise

- Use a cream canvas with a fine pale grid, a sage arc entering from the upper-right, and a restrained amber glow in the lower-right.
- Deep ink green is the main text color. Sage supports the interface and background.
- Amber is reserved for focus, CTA, and the active lane.
- Do not use coral review strips, PRE-LAUNCH labels, purple automation gradients, red speed bursts, dark event rings, or future teal-wave backgrounds.

A deliberate 40/60 split

Canvas: 1200 × 627 px. Essential elements remain inside a 72 px outer safe margin.

- Copy zone: left 40%. Product hero: right side, 46-54% of total width.
- Logo: separate top-right signature, minimum 150 px wide.
- CTA: lower-left amber filled pill, approximately 230-270 px wide and 56-68 px high.
- Required proof chip: visible near the copy block, but smaller and less prominent than the CTA.

Readable at feed size

- Headline: maximum two lines, clear line breaks, strongest element in the left column.
- Product name and release line: supporting labels, not substitutes for the headline.
- Support line: one concise sentence with comfortable spacing from headline and CTA.
- CTA and proof chip text must remain fully legible; do not shrink them to interface-label size.
- The final composition should look intentionally assembled, not like a large screenshot pasted over a template.
- Reject the output if it contains stray source fragments, clipped UI headings, partial weekday columns, hidden required copy, or elements touching the outer edge.

The asset register controls file eligibility. This guide controls visible treatment.
